11. Host Interface Timing Diagram

11.1 Power-up Sequence Timing Diagram

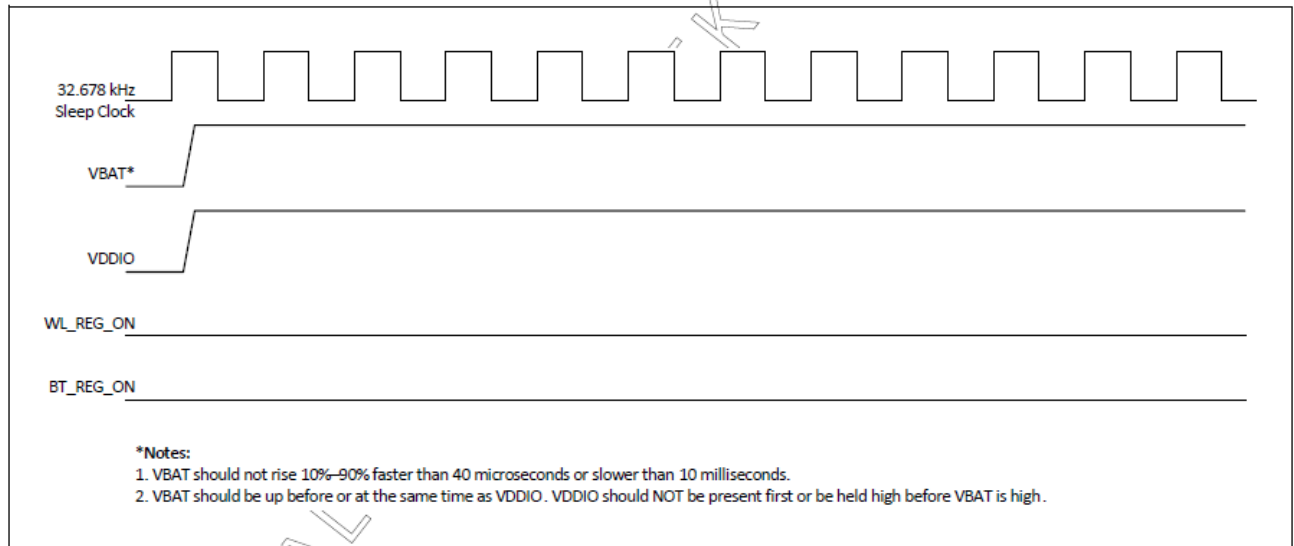

The module has signals that allow the host to control power consumption by enabling or disabling the Bluetooth, FM, WLAN and internal regulator blocks. These signals are described below.

Additionally, diagrams are provided to indicate proper sequencing of the signals for various operating states. The timing value indicated are minimum required values: longer delays are also acceptable.

- ※ WL_REG_ON: Used by the PMU to power up or power down the internal regulators used by the WLAN section. When this pin is high, the regulators are enabled and the WLAN section is out of reset. When this pin is low the WLAN section is in reset.
- ※ BT_REG_ON: Used by the PMU to power up or power down the internal regulators used by the BT/FM section. Low asserting reset for Bluetooth and FM. This pin has no effect on WLAN and does not control any PMU functions. This pin must be driven high or low (not left floating).
