1. Introduction

AMPAK Technology would like to announce a low-cost and low-power consumption module, with integrated dual band (2.4GHz/5GHz) IEEE 802.11 a/b/g and single-stream IEEE 802.11n MAC/baseband/radio and Bluetooth 4.0. It also integrates a low power NFC controller.

The integrated module provides SDIO V2.0 Host interface for Wi-Fi, high-speed UART is provided for the Bluetooth Host interface. Separate independent interface I2C for NFC are also provided.

This compact module is a total solution for a combination of WiFi dual mode + BT4.0 + NFC technologies. The module is specifically developed for mobiles, tablets or handheld wireless system devices.

2. Features

IEEE 802.11x Key Features

- Dual-band 2.4GHz/5GHz 802.11a/b/g/n.
- Single-stream IEEE 802.11n support for 20MHz and 40MHz channels provides PHY layer rates up to 150Mbps.
- WLAN host interface options: SDIO v2.0 up to 50 MHz clock rate
- Support a single antenna shared between WLAN and Bluetooth.
- Security: WEP, WPS, WPA, WPA2, WMM, WAPI, AES,...

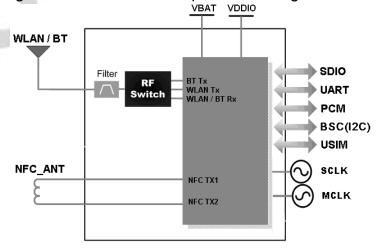

Bluetooth Features

- Bluetooth V4.0(BLE) Low Energy with provisions for supporting future specifications.
- Bluetooth Class1 or Class2 transmitter operation.
- BT host digital interface UART(up to 4 Mbps) with support all Bluetooth4.0 package types
- Multipoint operation with up to seven active ACL links, three active SCO and eSCO connections.
- Full support for power savings modes (standard sniff, deep sleep modes)
- ECI enhanced coexistence support, ability to coordinate BT SCO transmissions around WLAN receives

NFC Features

- Reader/Writer (R/W) mode
- Active and Passive Peer-to-Peer (P2P) mode
- Tag/card Emulation mode with supports dual Single Wire Protocol (SWP) interfaces for SWP_0/SWP_1 dual UICC SIM card.
- Lead Free design which is compliant with ROHS requirements.

A simplified block diagram of the module is depicted in the figure below.

3. Deliverables

3.1 Deliverables

The following products and software will be part of the product.

- Module with packaging
- Evaluation Kits
- Software utility for integration, performance test.
- Product Datasheet.
- Agency certified pre-tested report with the adapter board.

3.2 Regulatory certifications

The product delivery is a pre-tested module, without the module level certification. For module approval, the platform's antennas are required for the certification.

4. General Specification

4.1 General Specification

Model Name	AP6441		
Product Description	Supports Wi-Fi dual mode /Bluetooth/NFC		
Dimension	L x W x H: 12.0 x 12.0 x 1.5 (typical) mm		
WiFi Interface	SDIOV2.0 (4bit/1bit)		
BT Interface	UART/ PCM		
NFC Interface	I2C		
Operating temperature	-30°C to 85°C		
Storage temperature	-40°C to 85°C

9.1 SDIO Pin Description

The module supports SDIO version 2.0 for 4-bit modes (100 Mbps), and high speed 4-bit (50 MHz clocks – 200 Mbps). It has the ability to stop the SDIO clock and map the interrupt signal into a GPIO pin. This 'out-of-band' interrupt signal notifies the host when the WLAN device wants to turn on the SDIO interface. The ability to force the control of the gated clocks from within the WLAN chip is also provided.

- Function 0 Standard SDIO function (Max BlockSize / ByteCount = 32B)
- Function 1 Backplane Function to access the internal System On Chip (SOC) address space (Max BlockSize / ByteCount = 64B)
- Function 2 WLAN Function for efficient WLAN packet transfer through DMA (Max BlockSize/ByteCount=512B)

Host Interface Timing Diagram

10.1 Power-up Sequence Timing Diagram

The module has signals that allow the host to control power consumption by enabling or disabling the Bluetooth, WLAN and internal regulator blocks. These signals are described below.

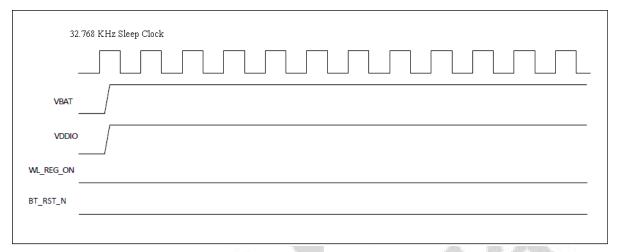

Additionally, diagrams are provided to indicate proper sequencing of the signals for carious operating states. The timing value indicated are minimum required values: longer delays are also acceptable.

- WL REG ON: Used by the PMU to power up the WLAN section. When this pin is high, the regulators are enabled and the WLAN section is out of reset. When this pin is low the WLAN section is in reset.
- BT RST N: Low asserting reset for Bluetooth only. This pin has no effect on WLAN and does not control any PMU functions. This pin must be driven high or low (not left floating).

Output hold time	tOH	2.5	-	-	ns	
Total system capacitance (each line)	CL	-	-	40	pF	

a. Timing is based on CL \leq 40pF load on CMD and Data.

10.4 BSC (I2C-Compatible)

Following are the main features of the BSC host interface:

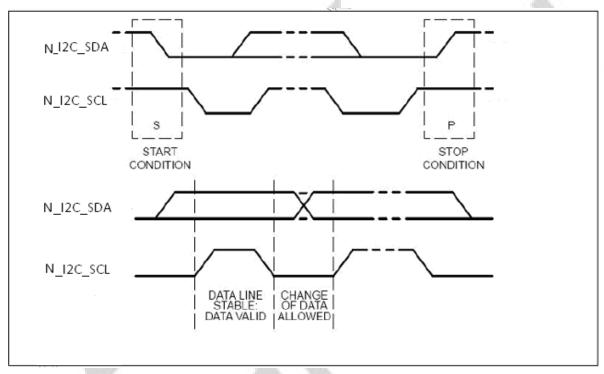

- Slave mode
- Low-speed mode (100 kbps), fast mode (400 kbps), and high-speed mode (3.4 Mbps) upported. Due topractical constraints imposed by parasitic capacitance and pull-up resistor values, especially in a multidrop system, recommend that this be limited to 1.7 Mbps.
- 7-bit or 10-bit addressing mode; default boot-up of fixed 10-bit address (0x1FA), thereafter configurable to 7-bit or 10-bit addresses

b. $min(Vih) = 0.7 \times VDDIO$ and $max(Vil) = 0.2 \times VDDIO$.

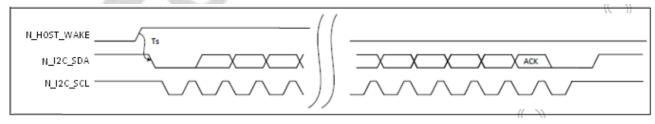

- Dedicated TX and RX FIFOs, 272 bytes each.
- Digital deglitching filter implemented. Uses simple majority of 3 and will filter spikes up to 42 ns.
- High-speed reference not required for operation. (Certain accesses in sleep mode will initiate the wakeup function.)

The BSC timing waveform is shown in

I2C Timing Waveform

NFC HOST WAKE is an output signal from the Module to the host that it wishes to communicate. The timing diagram shows NFC_HOST_WAKE as active high. The NFC_HOST_WAKE signal stays high until after the first byte has been read by the host.
